

AUTH.AS

Two-factor authentication system

The two-factor authentication is the easy way to protect your data.

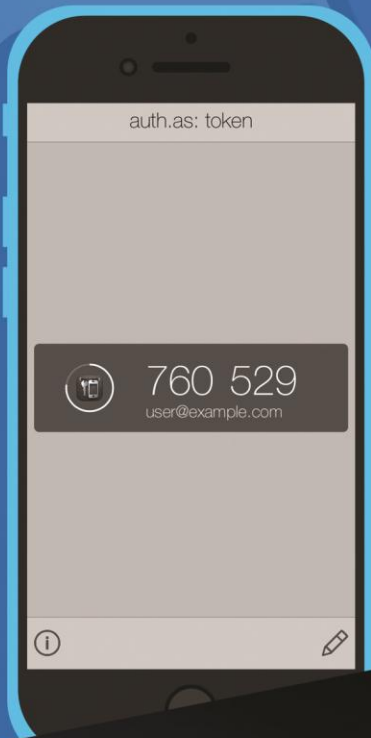

Two-factor authentication - what is it?

1

First factor is your password, which is "unknown" to everybody else :-)

2

Second factor is your other password, which is definitely not known to anyone, and even if someone gets a hold of it, it will be useless.

Two-factor authentication - why use it?

In a modern world information itself has become one of the most valuable resources.

Our service offers you easy tools to protect your valuable information from theft.

When two-factor authentication is in use, in most cases the difficulty and costs of obtaining your information by attackers devaluates their reasons to do it.

Two-factor authentication - why can it be relied upon?

Your second (one-time) password is generated using special algorithm and changes every 30 seconds. In other words interception of second password requires attacker to use it immediately and it still is not going to help an attacker as AUTH.AS service will consider it as already used and will fail authentication.

What can I protect with auth.as service?

 1С-БИТРИКС

 vmware®

 Drupal™

 SharePoint

 OPENVPN™

 1C

 Windows 10

 WORDPRESS

 CITRIX®

 RADIUS

 WEB

 Linux™
